

Handout 2 (pink) **Earth's Formation**

Determining Absolute Age

1. What is absolute age?

- **The numeric age**
- **Actual age in years**

2. Small amounts of what type of materials in rocks can act as natural clocks?

- **Radioactive materials**

3. Atoms of the same element that have different numbers of neutrons are called

- **Isotopes**

4. Radioactive isotopes emit particles and energy

- **At a constant rate regardless of surrounding conditions.**

5. In what way is the natural breakdown of radioactive elements most useful?

- **It can accurately measure the absolute age of rocks.**

6. The method of using radioactive decay to measure the absolute age of rocks is called

- **Radiometric dating**

7. The original radioactive isotope in a rock is called

- **The parent isotope.**

8. What are daughter isotopes?

- **A different isotope of the same element or an isotope of a different element into which a radioactive atom has changed as it emits particles and energy.**

9. What is a half-life?

- **The amount of time it takes for half the mass of a given amount of a radioactive isotope to decay into its daughter isotope.**

10. What is the half-life of carbon – 14?

- about 5,730 years

11. Why does radioactive carbon – 14 begin to decay after a plant or animals dies?

- **Because the organism is dead,
it no longer absorbs Carbon – 12
or Carbon – 14.**

12. Explain how radiometric dating is used to estimate absolute age.

- ***By comparing the percentage of a radioactive (parent) isotope to a stable (daughter) isotope in a sample of rock, and based on the known rate of decay (half-life) of the parent, scientists can calculate the length of time since the rock formed.***

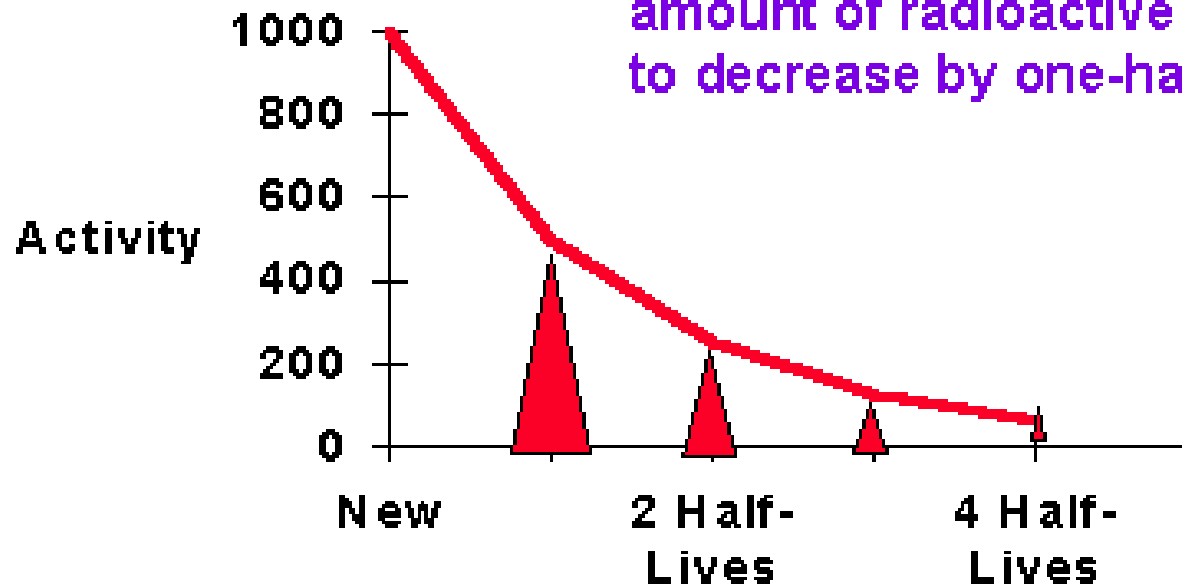

Radiocarbon Dating: Parent to Daughter

Half-Life

The time required for the amount of radioactive material to decrease by one-half

Chapter 28 Section 4

Asteroids, Comets, and Meteoroids

1. In addition to the sun, planets, and their moons, what occupies the space in our solar system?

- The solar system includes million of smaller bodies; some are tiny bits of dust or ice; others are as large as

2. What are asteroids?

- fragments of rock that orbit the sun

253 Mathilde - 66 × 48 × 44 km
NEAR, 1997

243 Ida - 58.8 × 25.4 × 18.6 km
Galileo, 1993

433 Eros - 33 × 13 km
NEAR, 2000

951 Gaspra
18.2 × 10.5 × 8.9 km
Galileo, 1991

5535 Annefrank
6.6 × 5.0 × 3.4 km
Stardust, 2002

2867 Steins
5.9 × 4.0 km
Rosetta, 2008

25143 Itokawa
0.5 × 0.3 × 0.2 km
Hayabusa, 2005

9969 Braille
2.1 × 1 × 1 km
Deep Space 1, 1999

1P/Halley - 16 × 8 × 8 km
Vega 2, 1986

9P/Tempel 1
7.6 × 4.9 km
Deep Impact, 2005

19P/Borrelly
8 × 4 km
Deep Space 1, 2001

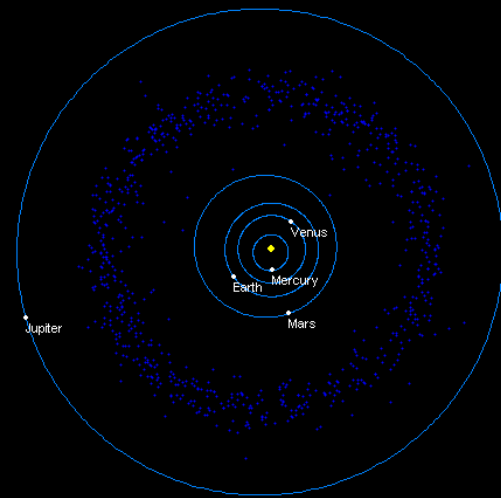

81P/Wild 2
5.5 × 4.0 × 3.3 km
Stardust, 2004

Dactyl
[[243] Ida I]
1.6 × 1.2 km
Galileo, 1993

Date: 2005/04/27

Petr Scheirich, 2005

3. Most asteroids are found in the asteroid belt located

- **between the orbits of Mars and Jupiter.**

Date: 2005/04/27

4. The composition of asteroids is similar to that of the

- **inner planets.**

5. For what reason do many astronomers think that asteroids in the asteroid belt were not able to form a planet?

- **because of the strong gravitational force of Jupiter**

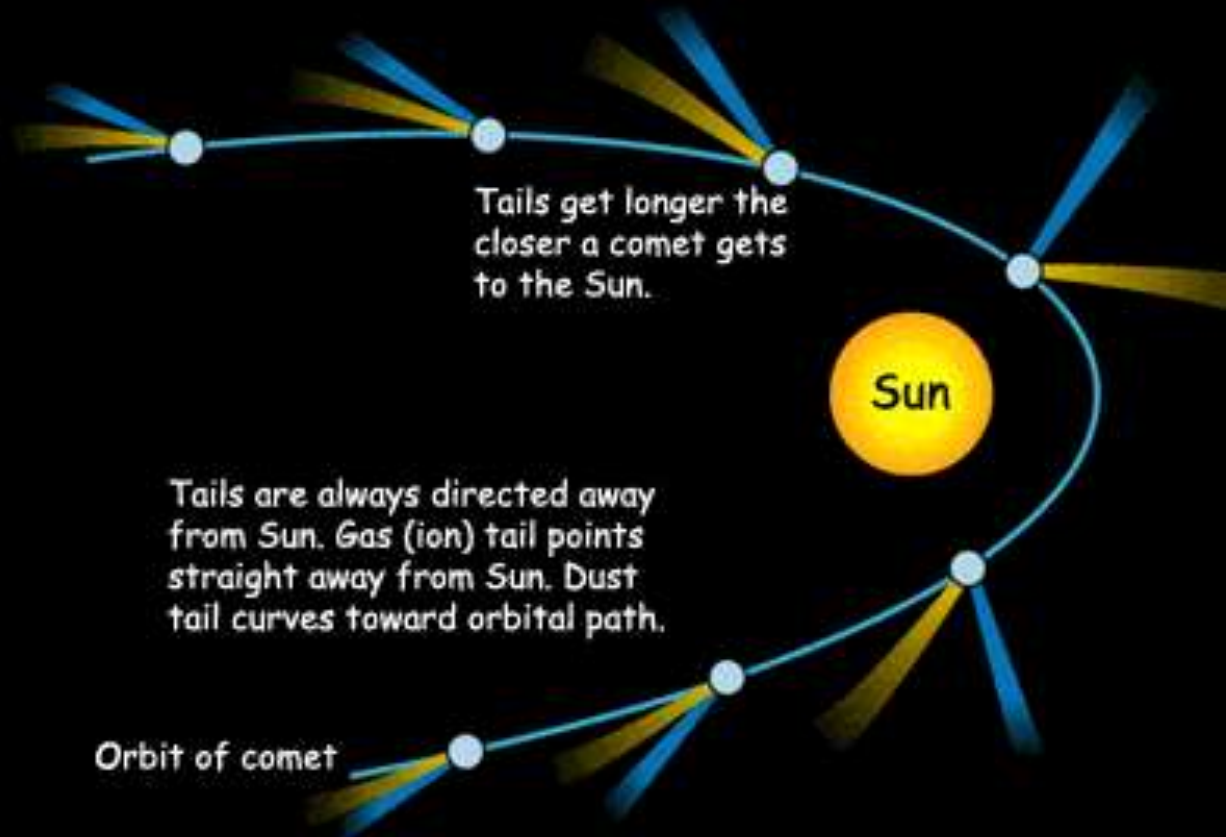

6. What is a comet?

- a small body of ice, rock, and cosmic dust that orbits the sun

7. A comet's spectacular tail forms when

- **sunlight changes the comet's ice to gas.**

Matching 8-13

8. meteor
9. meteor shower
10. iron meteorite
11. stony meteorite
12. meteorite
13. stony-iron meteorite
- a. a large number of meteoroids entering Earth's atmosphere in a short period of time.
- b. a bright streak of light that results when a meteoroid burns up in Earth's atmosphere
- c. a meteorite similar in composition to rocks on Earth that may contain carbon compounds
- d. the rarest type of meteorite
- e. a meteoroid or any part of a meteoroid that is left when it hits Earth
- f. a meteorite with a distinctive metallic appearance
-

Types of Meteorites

STONY

IRON

STONY-IRON

THE BARRINGER METEORITE CRATER

Fifty thousand years ago, a giant fireball streaked across the North American sky. It struck the earth in what is now northern Arizona, exploding with the force of 2 ½ million tons of TNT.

14. Why are the oldest meteorites important?

- **Because they may be 100 million years older than Earth and its moon, and thus may provide information about how the early solar system formed.**

The End...
